Waste Gas Scrubbing Systems

- Scrubber design calculations are made by taking into account the solution temperature and surface area of the process tanks.

- The Gas scrubber is a fully programmable unit.

- By taking into account the maximum capacity to be processed in the plant, special polipropylene aspirators are produced.

- The hydrogen that is released after the reaction of the Iron Oxide + Muriatic Acid and the HCl entrained with this hydrogen are also determined.

- The static and dynamic balances of these heavy duty aspirators are made by connecting to SCHENK Germany via internet and a certificate of result is obtained.
